### A legendary invention

Lecureux was founded in 1961 with the objective of offering innovative solutions to the watch and medical market in terms of tooling, measuring systems and assembly devices. This vision still drives us today.

More than 50 years ago, Lecureux revolutionized the industrial world with the invention of the electric screwdriver.

Since then, it has been widely used on several continents, in the watch assembly process and in other applications (such as optical or medical devices) where precision and accuracy are essential.

The use of vacuum has significantly reduced the time required to remove and insert screws, while improving the quality of the work.

Today, the eScrew and eScrew Speed models from Lecureux are sold worldwide and provide unparalleled precision and productivity. Our range is constantly being developed and completed by other types of screwdrivers, notably manual, with or without torque control.

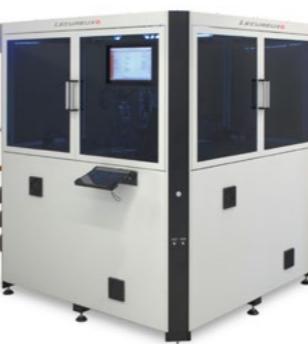

These products are widely used in the **watchmaking** industry but also in other sectors such as the **eyewear** or the **medical sector**.

### Beyond the electric screwdriver

Over the years, Lecureux has cultivated a strong expertise in mechanical and software engineering, automation, robotics and measurement.

Since 1980, the company has expanded its portfolio to include a full range of fully or partially automated assembly systems.

These include manual or electric screwdrivers, screwdriver controllers, numerous measuring and control systems, automated oiling and adjustment units, intelligent part transport and workflow systems, robotic assembly modules and quality control.

Designed for small and very small components, our products are fully developed and manufactured in-house, mainly for the Swiss, European and Asian markets.

### Help, guide and informations

The [memento](#) at the end of this catalog (page 66) provides informations about the criteria and parameters to consider when choosing the various elements that go into the composition of a suitable, high-performance tool.

## Basic elements

A electric screwdriver from Lecureux is composed of several components working together. To make your choice easier, we invite you to consult the [memento](#) at the end of this catalog (page 66).

### Main components required to use a screwdriver from Lecureux

### How to choose?

Finding the right solution for your production process requires to consider that all the various components of your screwdriver are linked as a chain. The first component to consider is the bit.

#### Bit (page 4)

In your production, the screw heads determine the choice of the [bit](#). The bit is first defined by the shape of the screw head, then by its dimensions.

For all orders, we will ask you to supply some screw samples and - at least - the drawing of the screw, with the shape and diameter of the screw head.

#### Head (page 25)

A [screwdriver head](#) is made up of several components.

The choice of the right components to use is particularly important in terms of performances and time saving.

#### Screwdriver (page 32)

The [Lecureux's range of screwdrivers](#) covers a very wide range of performances.

Depending on your production requirements, some characteristics need to be analyzed:

- Torque to be achieved
- Speed of rotation to be reached
- Precision of the screw position.

#### Controller (page 43)

The [control unit](#), also called [controller](#), depends on the type of screwdriver selected, the desired functions (measuring, control, data transmission) and the precision required.

All controllers offer the basic functions.

Lecureux offers you the factory calibration of the control unit chosen with a screwdriver.

## Versatile applications

In addition to manual use, electric screwdrivers and their controllers are also employed for specific applications such as winding, automatic time-setting, date jump detection or automated assembly applications.

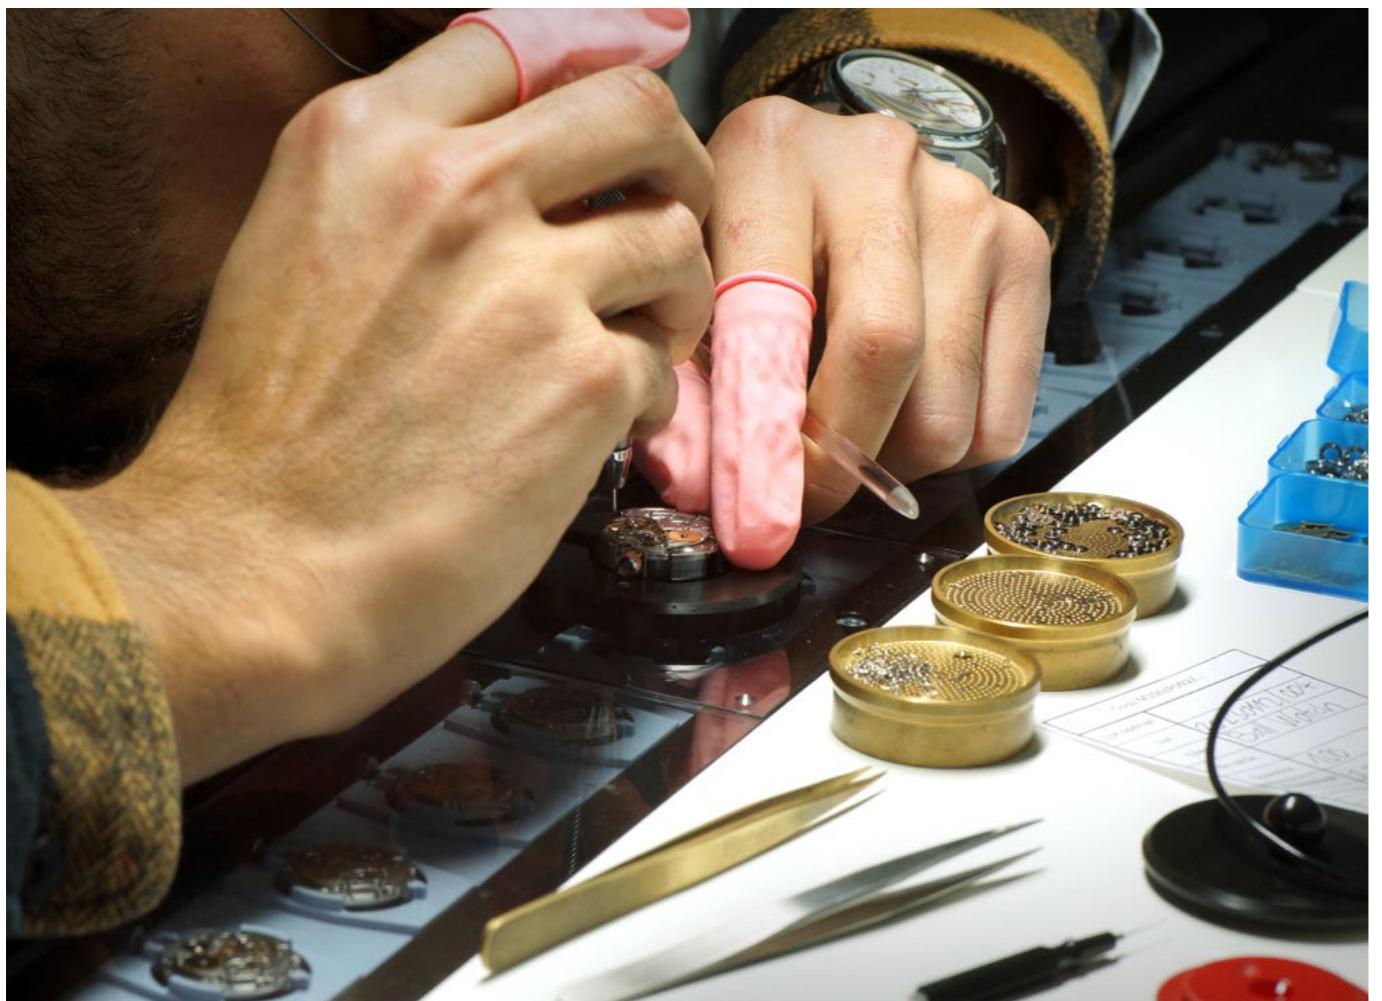

## Controllers

## Controllers

**Manual workstation enhanced by several automated modules**

**Author** stations are tailored to your production needs. Our range offers a wide variety of configurations, right up to complete production lines with dozens of stations.

In this example, the ergonomic station at the front of the workstation is used for manual operations.

The movement is lifted up on a custom-made support from its pallet to the working position and oriented in any directions, as required. Once the operations have been completed, the movement is returned back to its pallet.

At the rear of the station are two automated systems: a flipping module and a winding module.

You can find the same principle also used in our other products **BOA-S** and **One Tile Flow**.

The table below gives a quick overview of the available controllers for your electric screwdriver.

# Memento

**Mémento**

Cette section vous informe sur les différents paramètres à prendre en considération pour choisir les éléments qui accompagnent vos vis.

Ce catalogue contient les pièces standard de l'outil de tournevis Lecureux SA. Il est toutefois possible que vos besoins nécessitent des pièces non standard. Dans ce cas, nous vous proposons de prendre contact avec notre équipe (Service Client) et nous vous renverrons certaines recommandations.

**Avant d'aller plus loin...**

Avant de continuer la lecture de ce mémento, il est important de savoir si l'empêchement de la vis est accessible avec les composants standards.

Si la vis se trouve dans une ouverture de diamètre inférieur à 3,1 mm, ou si le diamètre interne d'une préparation de vis est inférieur à 2,25 mm, nous ne recommandons pas d'utiliser les vis standard, car elles ne figurent pas dans nos catalogues qui sont dédiés aux composants standards.

Nous vous proposons de prendre contact avec notre équipe (Service Client) et nous vous renverrons certaines recommandations.

**Diamètre de la douille en fonction de la tête de vis**

Quelle que soit la forme de la tête de vis, mesurez son diamètre. Cette valeur est utilisée pour déterminer plusieurs paramètres.

Le premier élément est le diamètre de la douille nécessaire. La douille devra être adaptée à la même taille que la tête de vis.

**Plat d'aspiration**

Si la vis n'a pas poids relativement important (notamment pour les vis dont la tête est supérieure à 2 mm), il est recommandé de choisir des meches munies de plat d'aspiration. Ceci permet un meilleur maintien de la vis dans la douille par augmentation du débit de recouvrement.

**Pour les têtes de vis coniques**

Pour les têtes de vis de forme conique nous recommandons de choisir des meches munies de plat d'aspiration. Ceci permet notamment d'améliorer la stabilité du positionnement de la vis avant son insertion.

**Formule**

**Pour les vis à fente**

Veuillez trouver dans cette section des indications sur le choix des meches et des douilles assorties ainsi que des recommandations pour choisir les éléments adaptés à vos besoins.

**Mèches en V**

Pour un meilleur résultat, nous recommandons la méthode suivante :

- Soufflante 0.02 mm au diamètre de la douille choisie
- Vagueur Optique/Géométrique
- Meche de fond de vis
- Meche de haut de la tête de vis

**Mèches en V arrondies**

Mèches en V arrondies sont un peu plus coûteuses que les mèches en V de forme standard.

Elles présentent les avantages suivants :

- Elles sont plus solides que les mèches en V
- Elles sont moins sensibles au rebord de la douille.
- Elles offrent de meilleures performances d'aspiration
- Elles sont plus rapides pour les meches en V de forme standard.

**La largeur de la tête de la vis (L) et sa profondeur (P)**

Si la vis n'a pas poids relativement important (notamment pour les vis dont la tête est supérieure à 2 mm), il est recommandé de consulter :

- La dimension de la douille (D) est inférieure à la largeur de la tête de la vis.
- La dimension de la meche (D') est le même que celui de la douille.
- Vérifier que la grandeur D est inférieure à la largeur de la tête de la vis.
- Vérifier que la grandeur C est inférieure à la profondeur de la tête de la vis.

**Mèches en T**

Pour un meilleur résultat, nous recommandons la méthode suivante :

- La dimension de la douille (D) est inchangé.
- La dimension de la meche (D') est le même que celle de la douille.
- Vérifier que la grandeur C est inférieure à la largeur de la tête de la vis.
- Vérifier que la grandeur C est inférieure à la profondeur de la tête de la vis.

**Dans l'éventualité où les dimensions recherchées ne sont pas dans les tableaux de ce catalogue standard, nous vous invitons à prendre contact avec notre équipe et à transmettre la largeur et la profondeur de la tête de vis.**

## Memento

This section gives you informations about the parameters to consider when choosing the right items for your needs.  
This catalog contains the **standard** parts for all the electric screwdrivers from **Lecureux**.

However, your needs may require **non-standard** parts.

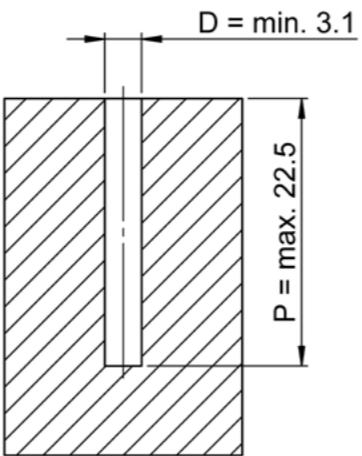

In this case please contact our team at [lecureux@lecureux.ch](mailto:lecureux@lecureux.ch) who will be happy to advise you.

## Before going any further...

Before reading on, it is important to know if the screw location is accessible with the **standard** components.

If the screw is located in an opening with a diameter of less than 3.1 mm or deeper than 22.5 mm, then solutions can be found in our others components that are not listed in this catalog.

Please contact our team at [lecureux@lecureux.ch](mailto:lecureux@lecureux.ch) who will be happy to advise you.

## Diameter of socket according to screw head

Whatever the shape of the screw head, always measure its diameter.

This value is used to determine several elements, like the vacuum socket diameter or its possible [Cut-away](#) option.

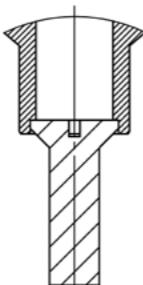

## Air-suction slots

Bits with air-suction slots provide increased retention of the screws in the socket due to increased vacuum flow.  
Contact our team at [lecureux@lecureux.ch](mailto:lecureux@lecureux.ch) for more information.

## For tapered screw heads

For this kind of screw heads we advise to :

- Add the [Cut-away](#) option (page 29) to the socket, to improve the screw positioning stability ;
- Opt for an adjustable head (pages 26 & 28).

Option	Order number

## For slotted screws

In this section, you'll find informations about the choice of the bits and sockets, as well as adviseations for selecting the right components for your needs.

- Add the [Cut-away](#) option (page 29) ;
- Indicate us the screw head diameter ;
- Indicate us the screw head height ;
- Internal diameter B and depth C determined by our team, always available to advise you at [lecureux@lecureux.ch](mailto:lecureux@lecureux.ch).

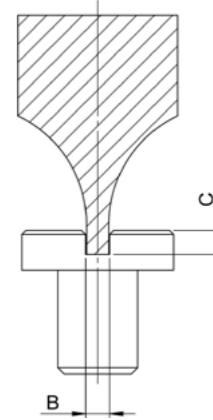

### V-bits with rounded tip

[Rounded tip V-bits](#) (page 8) are custom-made to answer your needs, and help a lot to preserve the edges of the screw head slots.

The width of the screw slot (B) and its depth (C) must be taken into consideration.

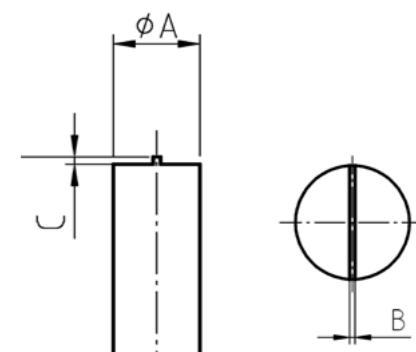

The thickness of the bit tip should be less than the value of B and greater than the value of C.

### T-bits

For the best results, we advise the following method:

- Unchanged socket diameter ;
- No [Cut-away](#) option on the socket ;
- Bit diameter (A) identical to socket diameter ;
- Dimension B smaller than the screw slot width ;
- Dimension C smaller than the screw slot depth.

If the dimensions you are looking for are not listed in this standard catalog, please contact us at [lecureux@lecureux.ch](mailto:lecureux@lecureux.ch) and let us know the width and depth of your screw slot.

## For crosshead screws

We advise selecting the standard type and sizes required.

- [PH bits \(page 14\)](#)

## Hexagonal head screws (Hex)

We advise selecting the standard type and sizes required.

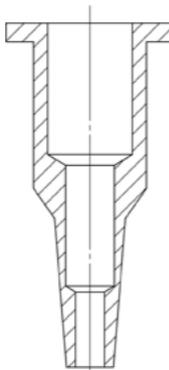

- [Hex bits \(page 15\)](#)

For large-diameter Hex screws, a [Flat end](#) option (page 29) can be added to the vacuum socket, allowing the screws to be sucked in.

Option	Order number
Flat end	0003.041.400-h

We advise [adjustable screw heads](#) (pages 26 & 28) for easy adjustments.

## For TORX® and TORX® Plus head screws

We advise you to select the exact type and the standard sizes required.

- [TORX® bits \(page 16\)](#)
- [TORX® Plus bits \(page 18\)](#)

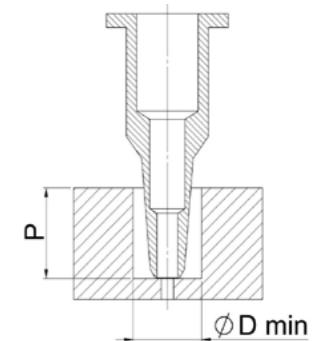

## Application limits for standard vacuum sockets (34mm)

For screws located in housings, standard 34 mm sockets (page 59) can be used within the limits shown in the drawing opposite and in the table below. Use 34 mm drill bits.

In case your requirements call for non-standard parts, please contact our team at [lecureux@lecureux.ch](mailto:lecureux@lecureux.ch) who we will be happy to advise you.

Housing opening Ø [mm]	Housing depth [mm]	Socket Ø [mm]
From 3.70	> 6.50	0.50 to 1.40
From 5.10	> 6.50	0.50 to 2.60
From 6.20	> 11.50	0.50 to 4.50

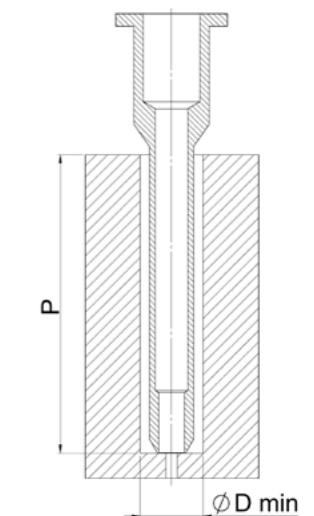

## Application limits for long vacuum sockets (50mm)

50 mm long vacuum sockets are an excellent solution for screws in deeper recesses.

Their limits are indicated in the table below. Use 50 mm drill bits.

Housing opening Ø [mm]	Housing depth [mm]	Socket Ø [mm]
From 3.10	> 22.5	1.00 to 1.90
From 3.70		1.00 to 2.50
From 4.20		1.00 to 3.00
From 5.20		1.00 to 4.00
From 5.70		1.00 to 4.50

## For other dimensions

If 34 mm and 50 mm sockets are not suitable for your application, we have other solutions to offer. Please indicate us the diameter of the housing opening and its depth by contacting our team at [lecureux@lecureux.ch](mailto:lecureux@lecureux.ch) who we will be happy to advise you.

## How to chose an electric screwdriver

In this section, we help you to determine the model of electric screwdriver you need according to three simple criteria:

1. The screw position ;
2. The screw torque ;
3. The screwing speed.

### 1. Screw position

The first criterion to consider is the screw position. If an accurate positioning of the screw during or at the end of operations is important, then the [TE-8xx](#) series (page 38) will be a perfect choice.

Otherwise, if the position of the screw is not of primary importance in your process, you can choose another model of screwdriver following the indications below.

### 2. Screwing torque

The second criterion is the screwing torque.

Depending the torque value needed for your process, you can make a selection from the models below.

If several screwdrivers match, the final choice will be determined by the screwing speed you need.

### 3. Screwing speed

The third criterion is the screwing speed.

If the speed needed is unknown, we suggest you to choose the 200 - 300 rpm range.

Model	Torque [N cm]	Speed [t / min]	Page
TE-100-E	0.05 – 1.40	80 - 600	33
TE-120-E11	0.50 – 4.50	80 - 500	34
TE-120-E22	1.50 – 6.00	100 - 400	34
TE-120-E41	3.00 – 12.00	50 - 300	34
TE-429-E	2.00 – 17.50	100 - 500	35
TE-531-E	3.00 – 26.00	100 - 500	36
TE-531-HP	4.00 – 35.00	70 - 400	36
TE-626-E	0.30 – 2.50	100 - 600	37
TE-626-E2	0.50 – 5.00	100 - 600	37
TE-626-E4	1.50 – 9.00	100 - 600	37
TE-826-B	0.50 - 5.00	50 - 1000	38
TE-831-B	5.00 – 25.00	50 - 1000	39

## Determining the controller for your electric screwdriver

Here is some help to determine which electric screwdriver controller model you need according to three simple criteria:

1. The controller for TE-8xx ;
2. The eScrew or TE-QC controllers ;
3. TE-QC: choice of the version.

### 1. Controller for the TE-8xx series

If an accurate screw positioning or a screwing speed exceeding 600 rpm is needed, your best choice will be a screwdriver from the [TE-8xx](#) series (page 38).

The only controller compatible with this series is the [eScrew Speed](#) (page 44).

Otherwise, you can choose another controller model by following the instructions below.

### 2. eScrew or TE-QC ?

The eScrew controller is much more technologically advanced and offers a wide range of functions, making it a high-performance tool (page 46).

If you are looking for a more simple controller, our range includes the TE-QC series (page 48), whose available versions are listed in the next section.

### 3. Which version of TE-QC?

The TE-QC controller (page 48) is available in four versions, to suit different applications.

	TE-QC Pro	TE-QC Armage	TE-QC Light	TE-QC Simple
Typical use	<ul style="list-style-type: none"> <li>- Screwing or unscrewing with a calibrated screwdriver</li> <li>- Detection of interchangeable screwdriver heads</li> <li>- Curves</li> <li>- Screw holding check</li> </ul>	<ul style="list-style-type: none"> <li>- Specially designed for winding</li> </ul>	<ul style="list-style-type: none"> <li>- Simple screwing with a calibrated screwdriver</li> <li>- Torque and speed selection</li> </ul>	<ul style="list-style-type: none"> <li>- Simple screwing</li> <li>- Torque and speed selection</li> </ul>
Available functions	Screwing Control	Winding	Screwing	Screwing
Calibration with screwdriver	Yes	No	Yes	No
Order number	0003.901.000	0003.901.000-a	0003.901.000-b	0003.901.000-c

## For greater productivity

In this section, we will take a look at some useful tips to get the most out of your electric screwdriver.

## Notes

### Choosing clip-on fasteners

Clip-on heads (page 27) allow you to save significant time when changing screwdriver heads.

### Adding the ZIP-41 base

This support (page 52) can store up to 4 screwdriver heads and transforms the productivity of your work tool, with quicker head changes and a perfect storage of these in a stable and dedicated housing.

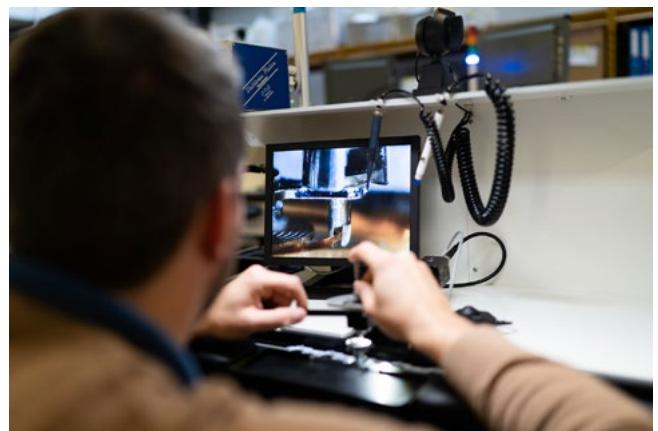

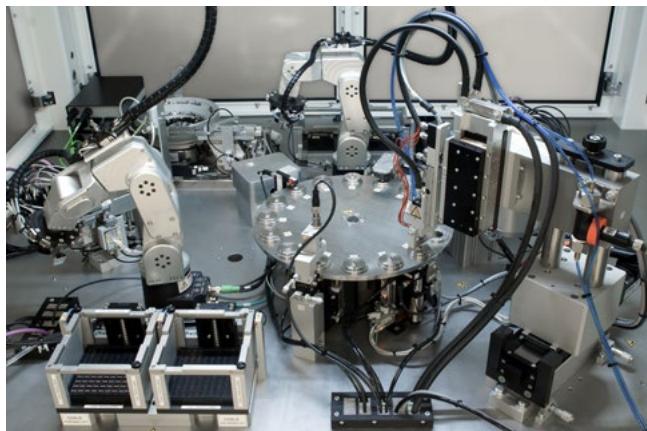

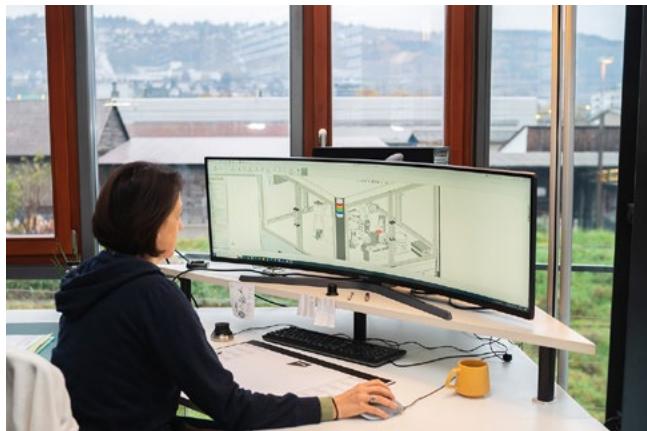

### Using a button, single pedal or double pedal

Whether you want to start a screwing or unscrewing cycle or simply to reverse the screwdriver direction of rotation, these physical controls (page 53) will come in very handy.

Use your controller to its full potential with dedicated ergonomic controls that you can operate without taking your eyes off your work.
